Bone and Joint Imaging. Bone and Joint imaging is performed by Professor Ciaran Johnston who leads our musculoskeletal service. Joint imaging and injections are performed for chronic pain and stiffness. Most imaging and injections require no patient preparation. Insurance cover: Direct billing is available for joint injections and MRI but depends on the source of referral, please ask a member of staff for further details.

Overview. A bone scan is a nuclear imaging test that helps diagnose and track several types of bone disease. Your doctor may order a bone scan if you have unexplained skeletal pain, a bone infection or a bone injury that can't be seen on a standard X-ray. A bone scan can also be an important tool for detecting cancer that has spread (metastasized) to the bone from the tumor's original location, such as the breast or prostate.

Full Body Bone Scan is a nuclear imaging test that helps diagnose and track several types of bone disease using tiny amounts of radioactive materials called tracers (radionuclides). These tracers accumulate in certain organs and tissues, such as bones. Once introduced into the body, tracers emit a type of radiation called gamma waves, which are detected by a special camera.

Bone & Joint also offers digital X-ray technology. Bone & Joint uses the most current digital X-ray technology to offer low-dose imaging services to our patients. Our digital imaging receptor is extremely efficient. The radiation dose is 1/3 less than that of a computed X-ray, which is commonly used in the market today.

A bone scan or bone scintigraphy / s n t r fi / is a nuclear medicine imaging technique of the bone. It can help diagnose a number of bone conditions, including cancer of the bone or metastasis, location of bone inflammation and fractures (that may not be visible in traditional X-ray images), and bone infection (osteomyelitis).

Musculoskeletal imaging will also help in determining the extent of the damage and the possible involvement of surrounding structures. Imaging investigations are not aimed at establishing the diagnosis of active brucellosis, as this will be achieved by other means, including history, symptoms, signs and laboratory investigations.

Bone and joint imaging is also known as skeletal scintigraphy or bone scan. In this exam, a small amount of radiopharmaceutical is injected into the bloodstream. It accumulates in areas of the skeleton where bone is being remodeled due to injury or disease. A specialized scanner is then used to identify these areas.
