The more meaningful way to connect to a MySQL database using PHP is to use the mysqli_connect function, it accepts 6 parameters overall, but most commonly, only four is needed. The four parameters we will use in this example are hostname, username, password and database name. The other two are port and socket, but we won't be needing them.

PHP MySQL Examples — The Ultimate Tutorial | Code Wall

Code lines to explain from the example above: First, we set up an SQL query that selects the id, firstname and lastname columns from the MyGuests table. The next line of code runs the query and puts the resulting data into a variable called \$result. Then, the function num_rows () checks if there are more than zero rows returned.

PHP MySQL Select Data — W3Schools

Here is an example (assume that \$result have already stored the return value from mysqli_query()): If you have some block of code like: <?php // Printing results in HTML echo "<table>\n"; while (\$line = mysqli_fetch_array (\$result, MYSQL_ASSOC)) { echo "\<tr>\n"; foreach (\$line as \$col_value) { echo "\<td> \$col_value </td>\n";

PHP MySQL extension overview example — Manual

MySQL Examples in Both MySQL and PDO Syntax. In this, and in the following chapters we demonstrate three ways of working with PHP and MySQL: MySQLi (object-oriented) MySQLi (procedural) PDO; MySQLi Installation.
